

Monitoring Server Group

Monitoring Server Groups provides features similar to Windows' Task Monitor that permit monitoring of server-side performance information during the play of Test Compositions. In SOASTA CloudTest, a Monitor Server Group defines the hardware or software end-point that will be monitored.

You can monitor System Resources, Application Servers, Databases, and ColdFusion development framework.

In SOASTA CloudTest, a Monitor Server Group typically requires the hostname and authentication credentials (with the exception of the built-in CPU Percentage, IO Kbytes Read, IO Kbytes Written, and Memory Usage of SOASTA CloudTest itself).

Further Steps

See [Creating a New Monitoring Server Group](#) for step-by-step instructions.
